Subject: Oregon cleanup program Risk-Based Concentrations

Hi, Katie and Rhonda ---

Not sure who else from our call this morning might be waiting for my response, so please forward on if appropriate. I talked to Keith Johnson in our cleanup program, who is heading up the DEQ soil sampling project. Paul Seidel, who is a toxicologist in the DEQ cleanup program, has already assembled a table of soil RBCs to be used to compare to soil data. Paul Seidel has done some situation-specific (referred to most often as site-specific) formula tweaks to our generic Risk-Based Concentrations to provide RBCs which are more representative of potential daycare exposures, etc.

These site-specific RBCs will be a lot more valuable to use to assess the soil samples taken near glass manufacturing facilities than the generic RBCs would be. Keith is planning on distributing this information via the Incident Command system, so at this point I will not be sending you RBCs.

I have cc'd Keith on this email. He is available if you want to contact him for more details. Have also cc'd my manager to keep him in the loop. Also, please let me know if there's more I can do. Thanks.
